

WHAT IS CLAIMED IS:

Sub q1

1. A signal processing apparatus, comprising:
processing means for executing a plurality of
processes for a plurality of processes;
5 assigning means for automatically assigning each
process with a unique code used for executing each of
the plurality of processes; and
control means for controlling said processing
means to execute the plurality of processes in
10 accordance with the code assigned by said assigning
means.
2. An apparatus according to claim 1, further
comprising input means for inputting program data,
15 wherein the plurality of processes include a process
for the program data input by said input means.
3. An apparatus according to claim 2, wherein the
plurality of processes include at least one of
20 processes of program reservation, listening/viewing
reservation, program detailed information display, and
program data reproduction.
4. An apparatus according to claim 1, further
25 comprising:
input means for inputting program data and program
information of the program data; and

005060" 22245960

searching means for searching the program
information input by said input means in accordance
with a predetermined search condition,

wherein the plurality of processes include a
5 process for the program data corresponding to the
program information searched by said searching means.

5. An apparatus according to claim 4, wherein the
plurality of processes include at least one of
10 processes of program reservation, listening/viewing
reservation, program detailed information display, and
program data reproduction, respectively for the program
corresponding to the program information searched by
said searching means.

15 6. An apparatus according to claim 4, wherein
said searching means sets a search condition for each
of a plurality of users.

20 7. An apparatus according to claim 4, wherein
said searching means adds a search point if a program
matches a search condition and selects a program having
a high search point, and the search condition includes
a condition that the search point lowers more as the
25 number of assignment times of the code by said
assigning means for the plurality of processes is
larger.

8. An apparatus according to claim 4, further comprising outputting means for outputting code information representative of a correspondence between a process to be executed for the code assigned by said assigning means and the code, wherein said searching means sets a plurality of search conditions, and said outputting means outputs the code information for a plurality of search results searched for each search condition.

9. An apparatus according to claim 8, wherein said outputting means outputs the code information for the plurality of search results to a printer unit.

10. An apparatus according to claim 1, further comprising outputting means for outputting code information representative of a correspondence between a process to be executed for the code assigned by said assigning means and the code.

11. An apparatus according to claim 10, wherein said outputting means outputs the code information to a printer unit.

12. An apparatus according to claim 11, wherein a code assignment process by said assigning means and a code information output process by said outputting

005060" 2245360

means to the printer unit are executed at a predetermined time.

13. An apparatus according to claim 12, further comprising setting means for manually setting the predetermined time.

14. An apparatus according to claim 11, wherein said outputting means outputs the code information to a display unit.

15. An apparatus according to claim 1, further comprising code inputting means for manually inputting the code, wherein said control means controls said processing means in accordance with the code input by said input means and the code assigned by said assigning means.

16. A signal processing method for executing a plurality of processes for a plurality of functions, the method comprising steps of:

automatically assigning each process with a unique code used for executing each of the plurality of processes; and

executing each of the plurality of processes in accordance with the assigned code.

005060" 22245960

17. A signal processing system, comprising:
processing means for executing a plurality of
processes for a plurality of processes;

5 assigning means for automatically assigning each
process with a code used for executing each of the
plurality of processes;

printing means for printing code information
representative of a correspondence between a process to
be executed for the code assigned by said assigning
10 means and the code;

code inputting means for manually inputting the
code; and

control means for controlling said processing
means to execute each of the plurality of processes in
15 accordance with the code assigned by said assigning
means and the code input by said code inputting means.

18. A printing apparatus, comprising:

20 inputting means for inputting code information
output from a signal processing apparatus which
automatically assigns each process with a unique code
used for executing each of a plurality of processes and
executes each of the plurality of processes; and

25 printing means for printing the code information
input by said inputting means.

19. A signal processing apparatus, comprising:

005060" 2245960

receiving means for receiving a television signal containing image data of a plurality of programs;

assigning means for assigning a code to each of the plurality of programs received by said receiving means;

recording means for recording the image data in a storage medium;

code inputting means for manually inputting an optional code; and

control means for controlling said recording means in accordance with the code manually input by said code inputting means and the code assigned by said assigning means.

20. An apparatus according to claim 19, further comprising reproducing means for reproducing the image data of the plurality of programs recorded in the recording medium, wherein said assigning means further assigns the code to each of the plurality of programs recorded in the recording medium, and said control means further controls a reproduction operation by said reproducing means in accordance with the manually input code and the assigned code.

21. An apparatus according to claim 19, wherein said assigning means includes searching means for searching the program matching the search condition

005060" 22745960

from the plurality of programs, and assigns the code only to the program searched by said searching means.

005060" 2245960

5 22. A signal processing apparatus for receiving a television signal including image data of a plurality of programs and for recording the image data into a storage device, said signal processing apparatus assigning a code to each of the programs of the received television signal, and a recording operation of the image data of the plurality of programs into the storage device being controlled in accordance with a selected code manually selected from the codes assigned to the plurality of programs and the codes assigned to the plurality of programs.

10

15 23. An apparatus according to claim 22, further reproducing the image data of the plurality of programs from the storage device and assigning a code to each of the programs of the recorded image data, and a reproducing operation of the image data of the plurality of programs from the storage device being controlled in accordance with a selected code manually selected from the codes assigned to the plurality of programs and the codes assigned to the plurality of programs.

20

25

24. An apparatus according to claim 22, further

performing a search of each of the plurality of
programs for programs matched with predetermined
requirement and assigning a code to the program found
out by the search.
